Duni launches breakthrough biomaterial Green PP

A step forward for the market – and the environment.

Unique on the market today, Green PP is an innovative bio-based material that offers all the functional benefits of conventional PP and is fully recyclable. Unlike the majority of plastics, which come from fossil fuels, Green PP is created from renewable resources – it is made from plants.

Consequently, Green PP enables restaurant and catering managers to ensure quality, minimize the environmental impact of their business, and send an attractive message to eco-conscious customers and staff.

The sealable Duniform® take-away trays are the first Green PP Duni is bringing to the market, and have been very well received by key customers during the pre-launch phase in 2014.
